- YOUR HOLU KIT-

INSTALLATION

Suggestion: To instal HOLU kit on the pipe outdoor with provided hose clamps.

✗ Do not install in direct sunlight and above water.

○ Install at least 2 meter above ground.

The USB adapter is not waterproof so it can't be placed outdoor without protection. The easier solution is to plug in the adapter indoor.

If you would like to hide the light generated by the kit, you can use the black sticker provided with the kit and place it on top of the light.

Every three months you should check if any animals found shelter inside the HoLu kit, clean potential dirt from the enclosure using a dry cloth.

OPERATION

1. Attach the USB cable

2. What does the light mean?

Power ON sequence

- **1. White**
HoLu kit is powered and starts to run.
- **2. Blinking blue**
SD card detected
- **3. Red**
HoLu kit is in registration mode, trying to access the network, and it starts to measure. This can take a few minutes, be patient.
- **4. Green**
HoLu kit has joined the network and is ready to send the data to the cloud.

Operation routine

- **Green**
HoLu kit joined the network and is measuring.
- **Blinking blue**
Happens every 3 minutes and it means that the data is saved in the SD card.
- **Blinking Green**
Happens every 3 minutes and it means that the data is sent to the cloud.

Download the data form our website

Your HoLu kit is identified by a unique ID, a number between 1 and 250. You can find the ID of your HoLu kit on the bottom side of the green board and on the sticker provided with the kit. To download the data from the HOLU kit, follow these steps:

1. Visit the website <https://hollandseluchten.waag.org/>
2. find your HOLU kit on the map, and click on it
3. In the detailview (graph) click on the button "Download data" and apply the settings you prefer.
4. At this point a file with your data will be downloaded.

Download the data from the SD card

You can also get the data of your HoLu kit from the SD Card of your kit. Turn OFF the kit and remove the card from Feather Adalogger module. Using the card adapter in the kit, you can read and download the data on your computer.

TROUBLE SHOOTING

→ If the registration takes more than 6 minutes, you can unplug and plug in again the kit (disconnect and reconnect the USB cable). If the kit keeps staying in registration mode, with the RED light on, for more than 10 minutes, it means there is no network and you need to contact the support.

→ If the data of your kit is abnormal, for example the temperature shows 0 degrees when it is August, or when the values(temperature, humidity and PM 2.5) stay the same for a few minutes, most probably the kit needs to be reset: unplug and plug again the kit (disconnect and reconnect the USB cable). If still the data of the sensor is abnormal, you need to check the connection, open the enclosure and disconnect the sensors. Be sure it is well plugged in to its connector.
